Commissioner

NON-DISCRIMINATION NOTICE

In accordance with Title VI of the Civil Rights Act of 1964 (42 U.S.C. §2000d et seq.), Section 504 of the Rehabilitation Act of 1973, as amended (29 U.S.C. §794), the Age Discrimination Act of 1975, as amended (42 U.S.C. §6101 et seq.), and Title IX of the Education Amendments of 1972, the Maine Department of Human Services does not discriminate on the basis of sex, race, color, national origin, handicap or age in admission or access to or treatment or employment in its programs or activities. Ann Twombly, Affirmative Action Officer, has been designated to coordinate our efforts to comply with the U.S. Department of Health and Human Services regulations (45 C.F.R. Parts 80, 84 and 91) and the U.S. Department of Education (34 C.F.R. Part 106) implementing these Federal laws. Inquiries concerning the application of these regulations and our grievance procedures for resolution of complaints alleging discrimination may be referred to Ann Twombly at 221 State Street, Augusta, Maine 04333, Telephone Number: (207) 289-3488 (Voice) or 1-800-732-1003 (TTY), or to the Assistant Secretary of the Office of Civil Rights, Washington, D.C.

Produced under Appropriation Number 1305.1065

June, 1989

ACKNOWLEDGEMENTS

Special acknowledgement is due to Richard Sherwood of the State Planning Office who provided total population bases (hereafter referred to as partial populations) for five age groups for ten successive years into the future.

Under the general guidance of Ellen Naor, Director of the Office of Data, Research, and Vital Statistics, this report was produced by Dale Welch, Senior Researcher. The report was typed by Sue Whitley and Sylvia Cunningham.

INTRODUCTION

This report presents a series of annual population projections beginning with 1987, the most recent year for which estimates have been calculated, and continuing with yearly projections ten years into the future. This is the seventh series of small area population projections, with a supplemental report of minor civil division population by age group, prepared by the Office of Data, Research, and Vital Statistics.

This publication contains two separate sections. The first section shows the projected population totals through 1997 for each minor civil division in Maine. The second section shows the projected population of 12 age groups by sex through 1997 for the state and each of the 16 counties.

The following supplemental reports are also available:

1. Population projections by county and town through 1997 for each of the age groups under 5, 5-17, 18-44, 45-64, and 65 and over. Price $22.50 per copy.

2. Methodology for Maine Population Projections by County, Age and Sex, Resource Series No. 11. Price $5.00 per copy.

Copies may be obtained by contacting the Office:

TECHNICAL NOTES

Methodology:

The projection methodology is based on age-specific partial populations. The age-specific partial population for a given geographic area in any year is the sum of the following two components:

(1) The age cohort aged forward the appropriate number of years from the date of the most recent population estimate.

(2) The projected net migration for the age cohort of the geographic area.

The age-specific partial population for a given age cohort thus excludes the natural increase of that cohort.

Age-specific partial populations for the state, for five age groups, were produced by the Maine State Planning Office for the years 1988 through 1997. Age-specific partial populations are then calculated for each Minor Civil Division (MCD) on the last census date (April 1, 1980) and on the date of the most recent population estimates (July 1, 1987).* The proportion or share of the state age-specific partial population represented by each MCD's age-specific partial population is computed for April 1, 1980 and July 1, 1987. Using the assumption that the annual rate of change in each MCD's share of the state age-specific partial population between the last census date and the last date of population estimate will continue throughout the projection period (1988-1997), the final projected age-specific partial population is calculated for each MCD for each year of the period being projected.

*Welch, D. Population Estimates for Minor Civil Divisons by County, Maine, 1987, Maine Department of Human Services, Office of Data, Research, and Vital Statistics, October, 1988.

The final population projection for each age group in each MCD is produced by adding the projected natural increase of each age cohort to the projected partial population of each MCD.

The following three basic assumptions are inherent in these projections:

(1) There will be a very small increase in the birth rate during the next decade.

(2) There will be a very small decrease in the death rate during the next decade.

(3) The net migration pattern during the next decade for each MCD will be the same as it was estimated to be during the 87 month period following the 1980 census.

It should be emphasized that the third assumption is by far the most critical factor in determining the quality of these projections, particularly for small geographic areas.

Projections of less than 100 are unrounded. Projections between 100 and 1,000 are rounded to the nearest 10 and projections greater than 1,000 are rounded to the nearest 50. The sum of a given component in these projections may not add to the state total because of these rounding procedures.

A more detailed description of the methodology is presented in Resource Series Number 11, "Methodology for Maine Population Projections, by County, Age, and Sex".

Quality of Projections:

Even though the state projections and the majority of the MCD projections appear to be quite reasonable, there are a number of MCD's for which the projections are questionable. Generally, the projections of poor quality can be classified into the two types listed below:

Type 1. Those due to a poor 1987 estimate.

Type 2. Those due to an unusually large rate of net-migration between April 1, 1980 and July 1, 1987.

Examples of these two types are Limestone (Type 1), and Orono (Type 2).

If reports from the Department of Defense on the number of Military Personnel at Loring Air Force Base are accurate, then we have a poor estimate of the population in Limestone, which would very likely cause an over projection of the future population of Limestone.

Orono had an unusually large net migration outward, perhaps due to a decrease in the number of University of Maine students residing in Orono over the 87 months following the 1980 Census. Since this change is not likely to recur, the rate of out-migration probably will not continue at such a high level in future years. However, the projection methodology assumes the high outward migration will continue, probably resulting in a spuriously low projection.

Users of this report should be aware of the assumptions inherent in these projections. If the assumptions are not valid for the geographic area of interest, then the projections should be used with caution and adjustments to the projections may be necessary for some purposes.

Assessing the Accuracy of Projections:

Although data are not available for precise calculations of the accuracy of these state and county population projections, some assessment of the magnitude of error can be made*. The minimum absolute percent error, as estimated in Tables 1-3, is based on the assumption that the estimated State of Maine populations prepared by the United States Census Bureau are perfectly accurate. The estimated maximum absolute percent error, shown in Tables 1-3, is based on the assumption that the estimates by the Census Bureau are of average quality. Therefore, based on the seven one-year projections of the total state population that we have made, the mean probable range of the absolute percent error is between 0.2 percent and 1.2 percent (Table 1). Based on the one seven-year projection that we have made for which data are available to test accuracy, the probable range of the absolute percent error is between 0.8 percent and 2.4 percent.

Based on these assumptions and on only five test observations, the 1990 state projection of 1,219,300 in this report is probably between $\pm$0.4% and $\pm$1.6% of what the actual figure will be. This probable range of error expressed in numbers of people is between 4,858-19,202 if the error is positive and between 4,897-19,826 if the error is negative.

*The projected figure may be greater or less than the (unknown) true value. This analysis deals with the absolute value of the percent error, regardless of whether it is positive or negative.

Table 2 shows the estimated absolute percent of error by county. The projections for York and Cumberland Counties appear to be the most accurate and those for Sagadahoc and Lincoln Conties, the least accurate. This is consistent with the known fact that the accuracy of population projections is positively correlated with both population size and the consistency of the pattern of net migration. Thus, based on the assumptions stated above, and only one test observation, a projection six years from the date of most recent estimate for York County has an estimated range in absolute error of between 2.3 and 4.9 percent. The estimated range for Sagadahoc County is between 16.3-20.5 percent. In terms of percentages, there is a very large difference between the best and the poorest projection. However, it should be noted that an error of 20.5 percent in Sagadahoc County represents a smaller number of people than a 4.9 percent error in York County.

Table 1

ESTIMATED ACCURACY OF PROJECTIONS OF THE TOTAL STATE OF MAINE POPULATION
BY YEARS SINCE MOST RECENT ESTIMATE

Years since Date of Most Recent Estimate	Number of Observations	Probable Range of Absolute Percent Error	
		Minimum	Maximum
1 Year	7	0.2	1.2
2 Years	6	0.4	1.6
3 Years	5	0.4	1.6

York	0.8-2.5	1.1-3.0	1.2-3.2	1.8-4.0	2.0- 4.4	2.3- 4.9
Mean Probable Range of County Absolute Percent of Error	0.8-3.1	1.0-3.6	1.3-4.2	1.9-5.0	2.7- 6.1	4.7- 8.3
Number of Observations	96	80	64	48	32	16

Table 3 shows the estimated accuracy of projections for specific age groups at the state geographic level. This table seems to suggest that for some age groups, especially those 'Under 5' and '65 and over', either we or the U.S. Census Bureau or both have produced projections of rather low quality. If our estimates for either or both of the above age groups are significantly too large, the following methodological procedure may be the explanation.

The first step in our population estimating procedure is to prepare unadjusted estimates by MCD for five age groups. These age group figues are then summed for all MCDs within each county to obtain an unadjusted county total population. An adjustment factor is then calculated from these unadjusted county totals and the county estimate of total population prepared by the United States Census Bureau. This county adjustment factor, which is usually greater than one, is used as a multiplier to force our county totals to equal those of the U.S. Census Bureau. This procedure improves the overall accuracy of our estimate of the total population of each MCD and county. However, if the unadjusted estimate for any age group is already accurate, the adjustment procedure will decrease the accuracy for that age group. If the 1990 Census reveals that such is the case, then research into alternative methods of weighted adjustment by age group is needed.

Table 3

ESTIMATED ACCURACY OF PROJECTIONS OF AGE SPECIFIC POPULATIONS:
PROBABLE RANGE OF ABSOLUTE PERCENT ERROR BY YEARS SINCE MOST RECENT ESTIMATE

Age Group	Years Since Most Recent Estimate					
	1 Year	2 Years	3 Years	4 Years	5 Years	6 Years
Under 5	2.6-4.6	3.0-5.3	3.9-6.4	4.9-7.6	6.3-9.3	7.5-10.6
